## Technology Advantage

Off-grid communication  
via mesh network

mesh:ine's unique technology connects smartphones directly to one another, independent of any cellular or Wi-Fi network. This results in a peer-to-peer wireless mesh network. Each device acts as a node for the network creating an independent infrastructure. Congested networks during crowd events, such as festivals and conferences, are no longer a problem. The technology enables advanced proximity features and location-based services. mesh:ine works cross-platform (iOS/Android), using different wireless standards such as Bluetooth LE and Wi-Fi.

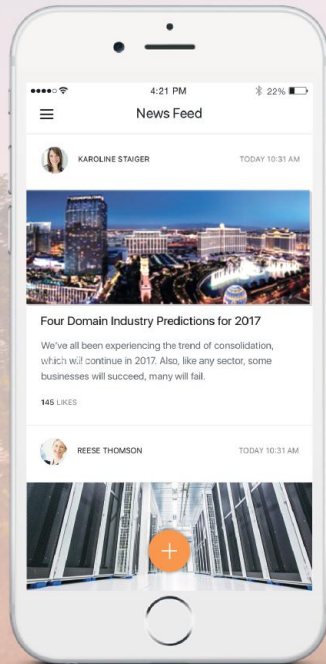

## About mesh:ine

Deep tech baked in Berlin

mesh:ine is a Berlin-based mobile tech start-up. mesh:ine uses mesh networks to deliver off-grid connectivity solutions to individuals and businesses. mesh:ine offers a mesh SDK to embed into other apps and customized app developments; enabling peer-to-peer communication and advanced proximity services. mesh:ine has been awarded winner of the Information & Communication Technologies Startup Competition by the Federal German Ministry of Economic Affairs. Furthermore, mesh:ine has received investment and acceleration by Telefónica.

## Event app

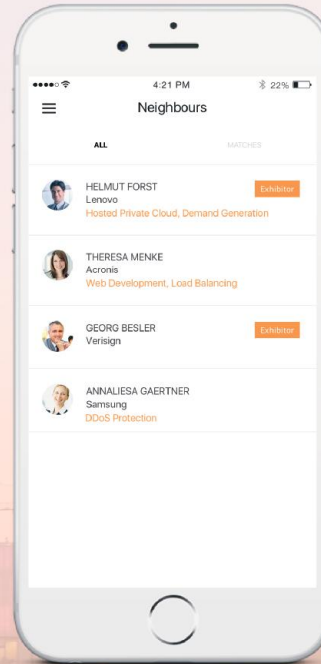

Customised according to the needs of your event

### Local News Feed

Users engage & interact

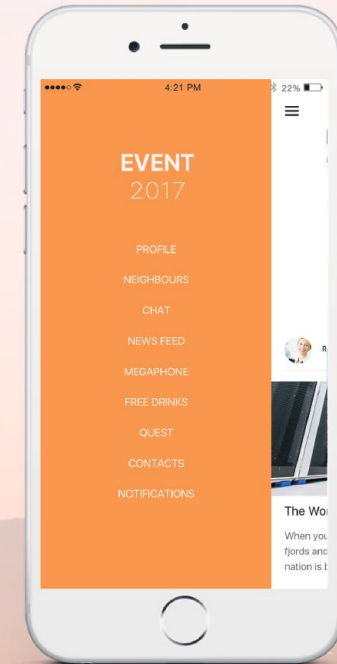

At the core of the event app is a user-generated News Feed with a unique location-based delivery and network independency (cellular or Wi-Fi). Users can post text or visual content, which will be sent and displayed to neighbours nearby. This meets the demand of crowd events for geographical relevance and proximity services.

### Proximity Features

Via iBeacons and smartphones

meshine's unique technology enables advanced proximity features, which includes interest-matching among users. iBeacons are used to create offers attached to specific areas such as booths or bars. The content is displayed as a sponsored post in the News Feed and can be activated through an extra menu point in the app.

### Feature Tool Box

Customized feature set

Several features can be added and customised such as individual profile pages, entrance ticket barcode scanner, interactive games, heat maps and ratings. In relation to peer-to-peer services, features can include digital business card exchange, messaging and file sharing.
